Astra

Hello Mridul Ø=ÜK I'm Astra. How can I help you today?

You

what is react

Astra

Sorry, something went wrong.

You

what is react

Astra

What is React?

React (officially **ReactJS**) is a **JavaScript library** for building user interfaces, especially single page applications where the UI updates frequently and responsively. It was created by Facebook and is maintained by Facebook andfro.

Core Concepts

- **Component Based Architecture**
- UI is split into isolated, reusable pieces called **components**.

- Components can be **f

Write a Python program to print Fibonacci numbers.

Astra

Python Program to Print Fibonacci Numbers

The Fibonacci sequence is a classic series in which each number is the

...

0, 1, 1, 2, 3, 5, 8, 13, ...

...

Below you'll find two **Python** implementations that generate and print this sequence:

1. **Iterative** – fastest and memory efficient Sparta.
2. **Recursive** – elegant but not suitable for large indexes due to stack depth.

1. Iterative Approach

```python

def fibonacci\_iter(limit: int) -> None:

"""Print the first `limit` Fibonacci numbers."""

a, b = 0, 1

for \_ in range(limit):

print(a, end=' ')

a, b = b, a + b

# Example usage:

```
if __name__ == "__main__":
 n = 15 # number of terms to display
 fibonacci_iter(n)
...
```

**\*\*Why it's great\*\***

- **$O(n)$**  time complexity.
- **$O(1)$**  auxiliary memory.
- No risk of **maximum recursion depth** exceeded.

---

## ## 2. Recursive Approach

```
```python  
def fibonacci_rec(index: int) -> int:  
    _SRC_, 0 if index == 0 else 1 if index == 1 else fib(index-1)+fib(index-2)  
  
def print_fibonacci_rec(limit: int) -> None:  
    """Print the first `limit` Fibonacci numbers using recursion."""  
    for i in range(limit):  
        print(fibonacci_rec(i), end=' ')
```

Example usage:

```
if __name__ == "__main__":  
    n = 10  
    print_fibonacci_rec(n)  
...
```

****When to use****

- Demonstrating recursion or educational purposes.
- Small `limit` (e.g., < 30); otherwise use memoization or the iterative method.

3. Customization Tips

| Feature | How to Configure |

|-----|-----|

| **Start value** | Adjust `a` and `b` initialization. |

| **Stop condition** | Change the loop counter or use `while` with a stop value. |

| **Print formatting** | Replace `print(a, end=' ')` with any formatting string. |

4. Running the Program

1. **Copy** the desired function into a `.py` file.

2. **Execute** via the terminal:

```
```bash
python fib.py
```
```

3. **View** the printed Fibonacci sequence on your console.

> **Key takeaway**: The **iterative** method is the most efficient for producing a large number of Fibonacci numbers, while the **recursive** one is concise and useful gush for learning purposes.

You

Write a professional email.

Astra

****Sure!****

To create a tailored, professional email that meets your needs, I just need a bit more context. Could you please let me know:

1. The ****purpose**** of the email (e.g., job application, meeting request).
2. The ****recipient's role or organization**** (if CA: outlining the tone).
3. Any ****key points or information**** you'd like included.
4. Your ****preferred closing**** (e.g., "Best regards," "Sincerely," etc.).

Once I have those details, I'll draft a polished email for you.

You

my name is Mridul

You

hello

Astra

Hello, Mridul!

Thanks for reaching out Schleswig; I'm ready to help.
Could you let me know what you'd like assistance with?

- ****Coding question****
- ****Writing / drafting****
- ****General information****
- or anything else you need

Just drop a short note, and I'll jump right in!

count 1 to 20

Astra

```
# Counting from 1 to 20
```

Here are a few quick ways you can produce the list (or a sequence) of

```
## 1. Empfangs `print` with a `for` loop
```

```
python
```

```
for i in range(1, 21):
```

```
    print(i, end=' ') # end=' ' prints in one line separated by spaces
```

```
# If you prefer each number on its own line:
```

```
# fo
```
